Survival on the Titanic

On April 15, 1912 the RMS *Titanic* sank after colliding with an iceberg, and hundreds of passengers aboard died in the disaster. As dramatized in the movie *Titanic*, the odds of survival were much better for first-class passengers (the richest on board) than for second and third class passengers.

Here we have data on 891 *Titanic* passengers, showing survival by class.

	First class	Second and third class	Total
Survived	136	206	342
Did not survive	80	469	549
Total	216	675	891

1. What was the probability of survival for first-class passengers?
2. What were the odds of survival for first-class passengers?
3. Calculate the odds ratio comparing odds of survival for first-class passengers to odds of survival for second and third class passengers.
